Intended use

The ISOMETER® monitors the insulation resistance R_f (R mode) or the insulation impedance Z_f (Z mode) of unearthed AC/DC main circuits (IT systems) with nominal system voltages of 3(N)AC, AC, AC/DC or DC 0 ... 440 V. DC components existing in 3(N)AC, AC/DC systems do not influence the operating characteristics, when a minimum load current of DC 10 mA flows.

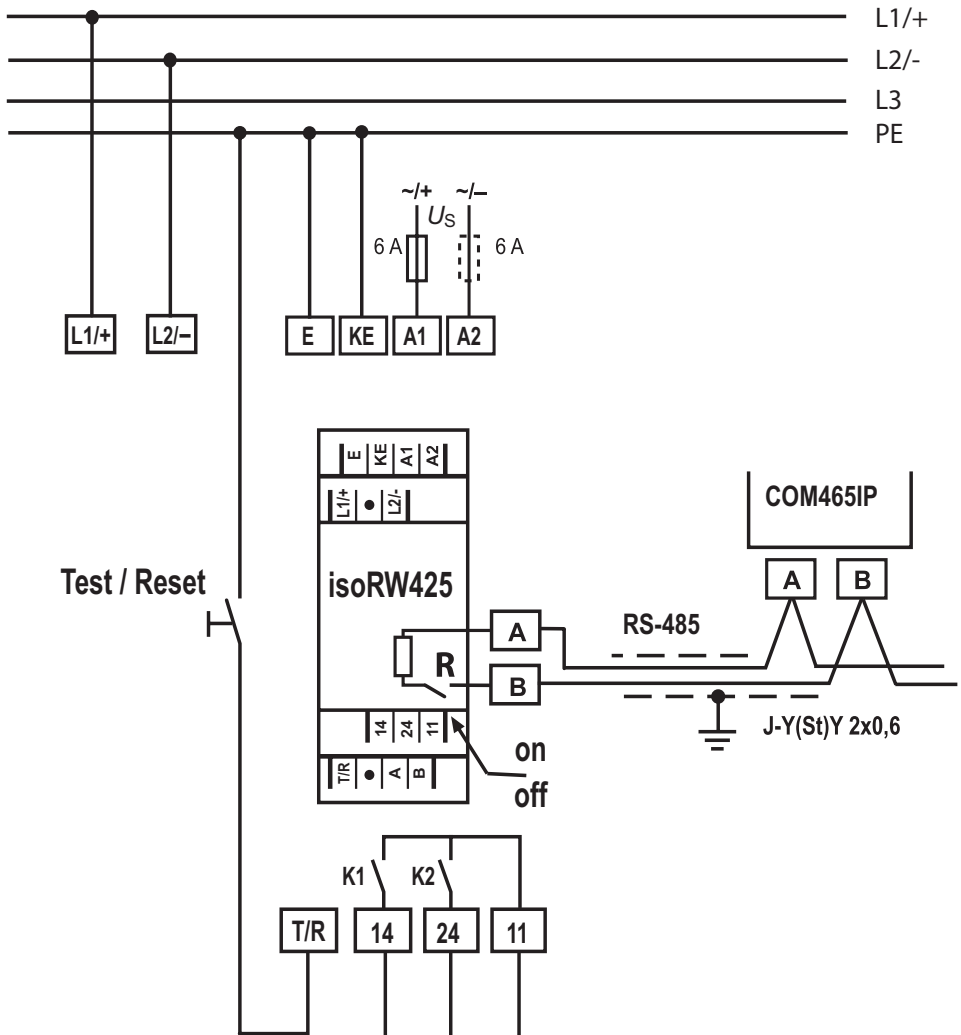

A separate supply voltage U_s allows deenergised systems to be monitored as well. The maximum permissible system leakage capacitance C_e is 300 μ F in R mode and 1 μ F in Z mode.

Any use other than that described in this quickstart is regarded as improper.

i *To ensure that the ISOMETER® functions correctly, an internal resistance of $\leq 1 \text{ k}\Omega$ must exist between L1/+ and L2/- via the source (e.g. the transformer) or the load.*

Wiring diagram

Wiring diagram legend

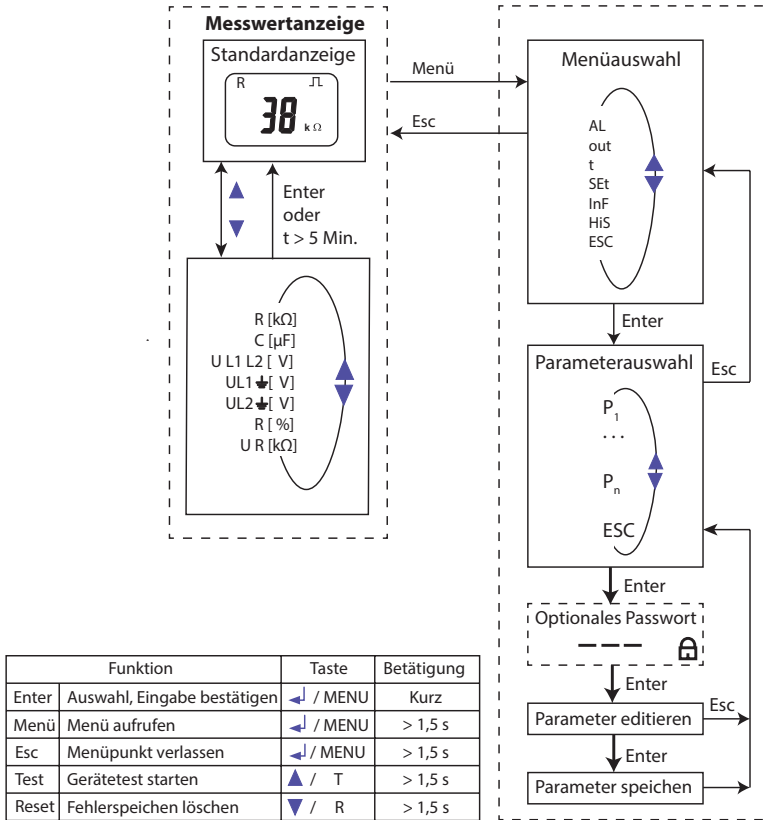

Terminal	Connections
A1, A2	Connection to the supply voltage U_s via a fuse: If supplied from an IT system, both lines have to be protected by a fuse.*
E, E, KE	Connect each terminal separately to PE: The same wire cross section as for „A1“, „A2“ is to be used.
L1/+ , L2/-	Connection to the 3(N)AC, AC or DC system to be monitored
T/R	Connection for external combined test and re-set button
11, 14	Connection to alarm relay „K1“
11, 24	Connection to alarm relay „K2“
A, B	RS-485 communication interface with selectable terminating resistance Example: Connection of a BMS-Ethernet-Gateway COM465IP

*** For UL applications:**

Only use 60/75°C copper lines!

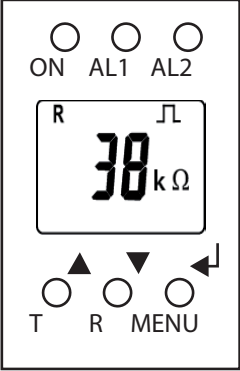

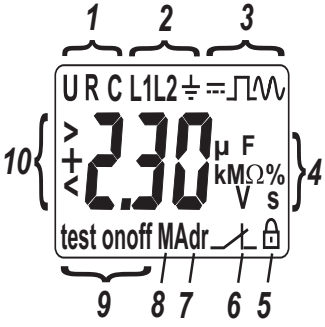

For UL and CSA applications, it is mandatory to use 5 A fuses for the protection of the supply voltage U_s .
